

WORK EXPERIENCE CERTIFICATE

Date: 20 August 2026

To Whom It May Concern,

This is to certify that Zaiti for Car Services Co. hosted the below-mentioned individual within its technical department as part of the Summer Training Programme 2026, for the period specified below:

- **Name:** Abdulrahman Ayman AlMasri
- **Role:** Full Stack Web Developer (Summer Trainee)
- **Department:** Software Engineering
- **Training Period:** From 28 June 2026 to 20 August 2026 (8 weeks, full time)

During this period, Mr. AlMasri worked on our customer web dashboard and internal tooling alongside our engineering team, and delivered the following:

- Designed and built a complete ticketing system end to end: a PostgreSQL data model, a NestJS REST API with create, list, detail and status-update endpoints and full input validation, JWT authentication, an admin-only dashboard with filtering and status management, and two separate submission paths, one public and anonymous and one for authenticated users with account context attached.
- Set up the delivery pipeline himself: continuous integration running lint, build and tests on every push and pull request, branch protection requiring CI to pass before merge, automatic deployment on merge, and both web and API deployed and verified on staging with the process documented.
- Documented the API for external integration with Swagger and OpenAPI, request and response examples, an authentication guide for outside systems and a written integration guide, then extended the system with ticket conversations, file attachments, search and status filtering, and full Arabic and English localisation with RTL and LTR support.
- Delivered a run of customer-facing features into the company's web dashboard: the support ticket redesign with a conversation view, invoice search and date filtering, an improved invoice details page, coupon redemption, rewards history and an interactive rewards feature.
- Produced a side-by-side web versus mobile feature gap report and turned it into an agreed build order with the team lead, and reported input-validation defects in the company website's contact form.

Mr. AlMasri works across the full stack with genuine independence. He took a ticketing system from written requirements through data model, API, authentication, front end, documentation and an automated deployment pipeline, and separately delivered a substantial share of the customer dashboard's features. His overall performance was rated Excellent.

This certificate has been issued upon the trainee's request and does not constitute any obligation or liability on the part of the company towards any third party, whether financial or otherwise.

We extend our sincere best wishes to him in all future endeavours.

Abdullah Alshami

Software Engineer | Training Supervisor
Zaiti for Car Services Co.
